1   Apache::httpd_conf - Generate an httpd.conf file

1.1 Synopsis

```
use Apache::httpd_conf ();

Apache::httpd_conf->write(Port => 8888);
```

1.2 Description

The Apache::httpd_conf module will generate a tiny httpd.conf file, which pulls itself back in via a `<Perl>` section.

Any additional arguments passed to the `write` method will be added to the generated httpd.conf file, and will override those defaults set in the `<Perl>` section. This module is handy mostly for starting httpd servers to test mod_perl scripts and modules.
