

**NAME**

latexminted – Python executable for the LaTeX minted package

**DESCRIPTION**

The LaTeX **minted** package typesets code with syntax highlighting using the Pygments library (<https://pygments.org/>). **latexminted** receives code and settings from the **minted** package, performs syntax highlighting and code formatting, and then passes the highlighted code back to LaTeX for typesetting.

**latexminted** is designed to be launched from within LaTeX via `\ShellEscape` by the **minted** package. It is not intended for direct usage.

See the **minted** documentation for installation and configuration details (<https://ctan.org/pkg/minted>).
